SUMMARY

Final-year Computer Science student who builds and runs software in production. Since early 2026 I have been the sole developer of an asset platform and Blender add-on used every day by about 100 animators at a 3D animation studio: a Next.js and TypeScript site, a Postgres database, 560 GB of models in object storage, and an AI feature that reads a script and finds the assets it needs. Comfortable owning a feature end to end – schema, API, interface, deployment and everything that breaks afterwards.

EXPERIENCE

Full-Stack Developer (Contract) – Dragon Pit asset platform 2026 - Present

The Future Animations (3D animation studio) – remote, sole developer

- Built and run the studio's asset library: Next.js (App Router) and TypeScript on Vercel, Prisma with PostgreSQL (Supabase), and Cloudflare R2 holding 560 GB of models, textures and renders. About 100 animators use it daily.
- Shipped an AI script breakdown on the Google Gemini API: a two-stage pipeline that reads a script, lists the characters, sets and props it needs, then casts each one against a 600-asset catalog. Structured JSON output, per-script caching, model fallbacks and quota handling, with deterministic rules on top of the model's answers.
- Wrote the offline matcher twice – TypeScript on the site, Python in the add-on – with an automated parity check so Blender and the browser can never return different assets for the same script.
- Built the Blender add-on in Python (bpy): catalog browse, one-click import, script matching, animation retargeting onto Character Creator, Rigify and Mixamo rigs, and self-update with a version kill switch for old copies.
- Automated the asset pipeline: read 600 zip indexes over HTTP range requests instead of downloading terabytes, ran headless Blender jobs to pack textures into single .blend files and render previews, and wrote audits that catch a missing texture before an animator does.
- Added role-based access with daily download limits, an admin dashboard (usage graphs, access requests, per-user download history) and a shopping list built from what scripts asked for and the library did not have.
- Closed a Supabase security alert by enabling row-level security on every table, checked end to end with no downtime.

PROJECTS

QPGen | Python, Flask, Gemini API, PostgreSQL, JWT
AI question-paper generator for teachers: builds questions by Bloom's Taxonomy level and difficulty, with JWT auth and a Supabase database. sem6-miniproject.vercel.app

Lead Generation Agent | Python, Playwright, Streamlit, pandas
Desktop agent that finds local businesses with a phone number but no website and exports a styled Excel report. Runs locally, no API keys. github.com/Akashkandari7/Lead-generation

Halebaked | Next.js, Tailwind CSS, MongoDB
Full-stack e-commerce app with a component-based architecture, multi-language support and a responsive layout. halebaked.vercel.app

SKILLS

Languages: TypeScript, JavaScript, Python, Java, SQL, HTML, CSS
Frameworks: Next.js (App Router), React, Node.js, Flask, Tailwind CSS, Prisma
Data and cloud: PostgreSQL, Supabase, MongoDB, Cloudflare R2 / S3 APIs, Vercel
AI and automation: Google Gemini API, prompt design with structured output, Blender Python (bpy), Playwright, pandas
Practice: Git and GitHub, REST APIs, JWT and OAuth, headless testing, row-level security

EDUCATION

B.E. Computer Science – K.R. Mangalam University, Gurgaon Expected 06/2027
Class XII (Senior Secondary) – D.A.V Public School, Kotdwara, Uttarakhand

CERTIFICATIONS

- Microsoft Azure Data Fundamentals
- Deloitte Data Analytics Job Simulation (Forage)
