SUMMARY

Final-year Computer Science student who builds and runs software in production. Since early 2026 I have been the sole developer of Dragon Pit, an asset platform and Blender add-on used every day by the animators at a 3D animation studio: a Next.js and TypeScript website, a PostgreSQL database, 560 GB of 3D models in cloud storage, and an AI feature that reads a script and finds the assets it needs. I own a feature from the first idea to the support call after release.

EXPERIENCE

Full-Stack Developer (Contract) – Dragon Pit asset platform 2026 – Present

The Future Animations (3D animation studio) – remote, sole developer

dragonpit.thefutureanimations.com

- Built and run the studio's asset library: a Next.js and TypeScript website on Vercel, a PostgreSQL database, and Cloudflare R2 storage holding 560 GB of models, textures and renders. About 100 animators use it every day.
- Shipped an AI script breakdown on the Google Gemini API. It reads a script, lists the characters, sets and props the story needs, then matches each one against a 677-asset catalog. Answers are cached per script, and my own rules check the AI's choices before an animator sees them.
- Built the Blender add-on in Python: browse the catalog, import with one click, break down a script, and retarget animation onto Character Creator, Rigify and Mixamo rigs.
- Wrote the same matching logic twice, once for the website and once for the add-on, with an automatic check so the two can never return different assets for the same script.
- Moved a 2,400-clip motion library of 2.3 GB into cloud storage so an animator downloads only the clips they actually use instead of the whole library up front.
- Made the add-on update itself without restarting Blender, so an update never interrupts work in progress, and added a switch that retires versions too old to be safe.
- Automated the asset pipeline with Blender jobs that run without a window: packed textures into single files, rebuilt 133 characters with full textures and rigs, rendered previews, and wrote checks that catch a missing texture before an animator does.
- Added role-based access with daily download limits, an admin dashboard for usage, access requests and download history, and a shopping list built from what scripts asked for and the library did not have.
- Closed a database security alert by making every table return only what the signed-in account is allowed to see, tested end to end and shipped with no downtime.

PROJECTS

QPGen | Python, Flask, Gemini API, PostgreSQL, JWT
AI question-paper generator for teachers: builds questions by Bloom's Taxonomy level and difficulty, with sign-in and a hosted database. sem6-miniproject.vercel.app

Lead Generation Agent | Python, Playwright, Streamlit, pandas
Desktop agent that finds local businesses with a phone number but no website and exports a styled Excel report. Runs locally, no API keys. github.com/Akashkandari7/Lead-generation

Halebaked | Next.js, Tailwind CSS, MongoDB
Full-stack e-commerce app with a reusable component structure, multi-language support and a responsive layout. halebaked.vercel.app

SKILLS

Languages: TypeScript, JavaScript, Python, Java, SQL, HTML, CSS

Frameworks: Next.js, React, Node.js, Flask, Tailwind CSS

Data and cloud: PostgreSQL, Supabase, MongoDB, Cloudflare R2, Vercel

AI and automation: Google Gemini API, Blender Python (bpy), Playwright, pandas

Practice: Git and GitHub, REST APIs, authentication (JWT and OAuth), automated testing

EDUCATION

B.E. Computer Science – K.R. Mangalam University, Gurgaon Expected 06/2027

Class XII (Senior Secondary) – D.A.V. Public School, Kotdwara, Uttarakhand

CERTIFICATIONS

Microsoft Azure Data Fundamentals • Deloitte Data Analytics Job Simulation (Forage)
